SUMMARY

Problem

Recent changes in the Fleet's approach to configuring the Authorized Minimal Medical Allowance Lists (AMMALs) have been implemented. The next step in the process is the clinical validation of the AMMAL items and the development of an audit trail linking the items to their mission requirements. Through this process, further advances in AMMAL efficiencies can be achieved by revising the AMMALs to contain only those items known to have a clinical task and patient-driven clinical requirement.

Objective

The primary objective of the study was to establish a clinical requirement for each item in the AMMALs carried aboard Independent Duty Corpsman (IDC) platforms. Using these requirements, 4 revised AMMALs, including the IDC core 7002, IDC supplemental 7001, IDC laboratory core 7004, and the IDC laboratory supplemental 7003, were produced. A secondary objective was to create an audit trail that provided an identifiable link between each final item included in the revised AMMALs and the specific tasks and patient types requiring them.

Approach

Subject Matter Experts (SMEs) developed IDC-level treatment profiles for 336 Patient Conditions (PCs) known to occur aboard ship. These profiles, consisting of individual tasks, described the step-by-step process of providing clinical care for each of the PCs in each IDC treatment location, including sick-call, laboratory, battle dressing station, preventive medicine locker, emergency and junior emergency response kits, first-aid kit, and antidote locker. Once the profiles were prepared, SMEs assigned the required materiel to the tasks. The items used by IDCs in sick call and the laboratory were then separated into either the IDC core (7002), the IDC supplemental (7001), the IDC laboratory core (7004), or the IDC laboratory supplemental (7003) and analyzed to assess the significance of the changes.

Results

Each of the 4 revised AMMALs was compared to the existing blocks to assess differences in the number of items, weight, cube, and cost. The results, shown in the following table, indicated that by establishing clinical requirements, reductions in the four measures could be achieved in 3 of the 4 AMMAL blocks reviewed.

	No. of Items	Weight	Cubic Vol.	Cost
Revised IDC Core	- 5.0%	-2.4%	-4.3%	-8.2%
Revised IDC Supplemental	-29.3%	-18.1%	-12.1%	-22.1%
Revised IDC Lab Core	5.9%	0.9%	7.7%	15.7%
Revised IDC Lab Supplemental	0.0%	- 3.9%	-8.0%	-4.4%

These reductions, realized in all but the IDC laboratory core, were achieved along with increases in clinical capability not currently available aboard the IDC platforms.

A second examination of the results looked at the factors responsible for the revisions. Each proposed revision was coded to reflect the type of justification SMEs used when agreeing to add, delete, or move an item to another AMMAL. The results showed that item changes occurred primarily because of (1) the failure to identify a clinical requirement or identification of clinical requirements not currently being met, (2) the identification of obsolete technology or the introduction of technologically superior materiel, and (3) the removal of items found to be redundant with other pieces of materiel.

Conclusions

Each of the study's objectives was achieved. A knowledge base of shipboard medical events was created, a comprehensive set of shipboard PCs was identified, treatment profiles were prepared, and medical supply items were assigned to each of the tasks in the profiles. Through this process, clinical requirements for the items in each AMMAL on the IDC platforms were identified, resulting in the validation of the work begun during the October 97 standardization conference. While an overall reduction in materiel occurred through the deletion of items found to be redundant or lacking a clinical requirement, other items were added to achieve clinical requirements not currently being met. As a result, this provides the IDC with greater capability in achieving current standards of care and more closely matches shipboard medical materiel with skills IDCs are trained to perform.

With the IDC knowledge base complete, a foundation has been established upon which the supplemental AMMALs of the Fleet's remaining platforms can be evaluated. Because of its IDC-based medical departments, application of this method of optimizing the AMMALs should proceed next with the submarine force. As the program begins to encompass the larger deck platforms, including the GMO, LHA/LHD and carriers, more sophisticated medical resource modeling efforts will be introduced. Because these larger platforms have much larger quantities of materiel, used at higher rates than those of the smaller decks, they can uniquely benefit from modeling supply usage characteristics. This will be accomplished by establishing the relative frequency that each of the PCs occur across the Fleet from data collected from sources such as the Shipboard Automated Medical System and casualty estimation models produced by the Naval Health Research Center.

Identifying Clinical Requirements for Independent Duty Corpsman Shipboard Medical Materiel

INTRODUCTION

Medical modeling has applicability to mission rehearsal, requirements definition, and readiness posture. Currently, models are being used by the services to determine theater medical requirements.¹⁻⁷ A key component to many of these models is a knowledge base of medical treatment. This knowledge base is composed of detailed treatment protocols that describe the medical care sequence a casualty would receive.

Currently, no medical resource modeling effort has been directed toward the logistical requirements of the Navy's surface fleet. The Navy's surface fleet medical responsibilities and treatment platforms are diverse, and range in clinical complexity from Independent Duty Corpsman (IDC) to surgical specialist.⁸ Because of the quantity of items used to administer care, the requisition, storage, and maintenance of the medical materiel on these platforms places a significant burden upon the ships' medical department personnel. Any reduction in items that could be achieved using clinically derived shipboard treatment protocols could reduce medical department complexity while potentially decreasing costs due to the elimination of item redundancies.

Confronted with reductions in funding levels, and increasingly larger materiel assemblages, the Naval fleet, together with the Naval Medical Logistics Command (NAVMEDLOGCOM), Fort Detrick, MD, embarked on an effort to both reduce logistics requirements and enhance standardization of materiel across the Fleet's different platforms. To augment this effort, a new approach to organizing materiel was applied. In this approach, a single block of materiel would constitute a core set of supplies. This core set of supplies would differ between platforms only in the quantities of items stocked. Items that are platform specific would then be stocked in supplemental blocks that each platform would build to meet its own unique requirements.

Application of the core and supplement materiel concept was introduced at the Authorized Medical Allowance List Standardization conference held at NAVMEDLOGCOM October 14-24, 1997. Medical logistics personnel and medical department representatives from the Fleet's 6 platforms afloat, including IDC ships, submarine tenders, submarines, General Medical Officer (GMO) ships, aircraft carriers, and LHAs and LHDs, attended. At the conclusion of the conference, a core block of materiel had been created, supplemental blocks for each individual platform configured, significant reductions in materiel achieved, and standardization of items across platforms applied. Furthermore, quantities of materiel were established to conform to a new criterion for the materiel assemblages. This criterion identified the minimum medical materiel requirements for a ship. To be consistent with the new criterion, the materiel assemblages were renamed the Authorized Minimal Medical Allowance Lists (AMMALs).⁸

With the new materiel concepts in place, the next step in refining the medical supply blocks rests with validating the remaining stock, establishing clinical requirements for each item in the inventory, and developing an audit trail that identifies the specific treatment protocols and types of patients requiring each piece of materiel. Accomplishing this objective requires the

identification of the major classifications of PCs seen aboard ship and the development of clinical treatment protocols based upon standards of care appropriate for the Fleet.⁹ In the present study, researchers at the Naval Health Research Center (NHRC), San Diego, CA, applied this approach to determine the best complement of shipboard materiel. To accomplish this objective, a shipboard patient treatment knowledge database was developed. Patient conditions, including battle trauma, disease, and non-battle injury, were identified and treatment protocols created that diagrammed the courses of clinical care conducted on Commander Naval Surface Force U.S. Pacific Fleet's (COMNAVSURFPAC's) 60 IDC ships. Using these protocols, the optimum mix of medical materiel necessary to achieve shipboard standards of care was determined. The mix of materiel identified through these means was then compared to current AMMAL stocks to assess differences in weight, cube, cost, and clinical capability.

METHOD

Four of the surface fleet's AMMALs were examined in the current study. These included the two IDC sick-call AMMALs 7002 (core) and 7001 (supplemental), and the two IDC laboratory AMMALs 7004 (laboratory core) and 7003 (laboratory supplemental). While these 4 AMMALs were the primary focus with regard to the analyses and results, treatment briefs and clinical requirements were also developed for the remaining AMMALs present on the IDC ships. These additional supply blocks included AMMAL 0955 (battle dressing station), AMMAL 0964 (portable medical locker), AMMAL 0924 (emergency response kit), AMMAL 0644 (junior emergency response kit), AMMAL 0627 (first-aid kit) and AMMAL 0925 (antidote locker).

Unlike the IDC sick-call and laboratory AMMALs, the 0955, 0964, 0924, 0644, 0627, and 0925 are present on each of the Fleet's platforms. Therefore, while the PCs for these AMMALs have been identified, and the treatment briefs and clinical requirements for the materiel prepared, the results for each must still be examined in light of each platform's unique requirements. Therefore, the results of the examination of these supply blocks will be presented in another paper.

Participants

Fifty-six clinicians experienced in shipboard medicine and combat casualty care participated in the study. These Subject Matter Experts (SMEs) were drawn from 7 medical commands (Table 1). The medical specialties within this group of SMEs consisted of 26 IDCs, 7 physicians, 5 GMOs, 2 physician's assistants, 1 pharmacist, 1 nurse, 6 IDC instructors, 2 force master chiefs, and 6 laboratory technicians. Most SMEs had shipboard operational experience as senior medical department representatives.

Joint Readiness Clinical Advisory Board	

Procedures

The development of the shipboard treatment briefs began with the identification of the clinical events known to occur on Navy ships. The Joint Readiness Clinical Advisory Board (JRCAB) has identified 319 tri-service PCs covering battle injuries, diseases, and non-battle injuries known to occur during military operations.¹⁰ To ensure these PCs were applicable to Navy medicine, the PCs were presented to clinical panels composed of SMEs. To better describe shipboard medicine, the SMEs modified 17 of the PCs and added an additional 17 not covered in the JRCAB list. For example, some of the new PCs included electrical shock; motion sickness; poison ingestion/inhalation/contact; and verruca, plantar, anal, and genital condylomas. Furthermore, the SMEs added 10 Preventive Medicine Objectives (PMOs) IDCs must address as part of their routine shipboard responsibilities. Appendix A lists both the shipboard PCs and the PMOs used in this study.

Before treatment protocols could be prepared for the 336 PCs, the clinical capability of shipboard areas where the medical supply blocks used to treat the PCs are stored was identified. This was accomplished so that a uniquely tailored protocol could be written for each PC that reflected the capability of the various treatment locations aboard ship. SME panels were again formed to determine which of the ship's medical stocks could potentially address each of the PCs. These panels examined each PC and determined which supply block, including the sick call IDC core and supplemental, the Battle Dressing Station (BDS), Portable Medical Locker (PML), Emergency Response Kit (ERK), Junior Emergency Response Kit (JRERK), the IDC laboratory core and supplemental, first-aid kit, or antidote locker, had the appropriate treatment capability. This process was then repeated for the PMOs. Appendix A shows which shipboard treatment area and supply block each PC/PMO could address.

Once the potential treatment locations were identified for each PC, treatment protocols were prepared. SME panels were again formed to examine the PCs within the context of the clinical capability of a ship's various treatment locations and medical supply blocks. The clinical processes carried out by IDCs were diagrammed for each PC. Then each of the clinical processes was broken down into individual steps representing the specific tasks required to administer care. An example of one of the battle injury treatment briefs, PC 087, is shown in Table 2.

Table 2

ZZ18	Clean & Sterilize Instruments	Sick call							100
595	Blood Gas Estimation (Requires I-Stat)		Lab						100
596	Electrolytes (Requires I-Stat)		Lab						100
604	Blood Urea Nitrogen (Requires I-Stat)		Lab						75
614	Hematocrit Level		Lab						100
613	White Blood Cell Count		Lab						50
615	White Blood Cell Count Differential		Lab						50

It can be seen from Table 2 that the treatment tasks are matched to clinical care of the provider, and to the medical mission and capability of the treatment area. For example, the treatment profiles for battle casualties in both sick call and the BDS are very similar because sick call is designed to function as a secondary BDS, when required. As the clinical sophistication of the treatment area decreases, so does the clinical complexity of the brief. This is illustrated in some of the differences between the PML and JRERK where, for example, IVs may be administered if treatment is performed from a PML but not when performed using the JRERK.

To provide a more accurate assessment of the quantity of materiel each of the PCs would consume during the treatment process, 4 additional fields were added to the database. Because the same PC can potentially present with slightly varied clinical manifestations, a field designed to capture these sensitivities was added. This field, labeled *% of patients*, is shown in Table 2. The values in this field represent the percentage of patients who might receive each of the tasks. For example, it can be seen in Table 2 that 100% of patients with PC 087 will receive treatment to control hemorrhage. However, difficulty in achieving or maintaining an airway that would result in the necessity to perform a cricothyroidotomy has a lesser probability of occurrence and therefore a lower value in the *% of patients* field. Through the capture of these subtleties, greater precision in estimating supply requirements is achieved.

Additional fields were added to the database to capture changes in supply consumption based on the estimated length of stay at the treatment site and the number of times each task could be expected to be performed during the length of stay. Data estimating the length of stay are important because of the variation in treatment time and patient holding between treatment locations. For example, in sick call, the treatment time may be as long as a couple of days. Extended patient stays may occur due to specifics related to weather, evacuation asset availability, or combat posture which can significantly delay evacuation. In contrast, the time for treatment by an IDC using the ERK may be less than 1 hour. In addition, 2 fields were dedicated to the number of times each task could be expected to be performed during the length of stay. The first field shows the number of times the task is performed on the first day, and the second, the number of times the task is performed, if appropriate, on each subsequent day.

Once the treatment profiles were constructed, the medical materiel required to conduct the tasks in the profiles was determined. SMEs were again consulted. The tasks were presented to the SMEs, and the appropriate mix of materiel was assigned to each. Where suitable, SMEs were asked to select the items needed from the existing AMMALs to minimize unnecessary change. When clinical requirements could not be achieved with current items because of advances in medical technology or changes in standards of care, new items were added. Each time a new item was added, it was selected from the Department of Defense tri-service approved inventory of medical materiel supplied by JRCAB. Appendix B lists each clinical and preventive medicine task and the supplies required to conduct the tasks.

At the conclusion of this phase of the study, the clinical requirements for each item on the IDC platforms had been identified. The items used by IDCs in sick call and the laboratory were then separated into either the IDC core, the IDC supplemental, the IDC laboratory core, or the IDC laboratory supplemental and analyzed to assess the significance of the changes.

RESULTS and DISCUSSION

The data were examined to provide four primary views of the results. The first was an examination of the treatment profiles developed by the SMEs. These profiles were used to determine the domain of medical tasks conducted by IDC level-practitioners and the shipboard treatment areas where these tasks could be effectively performed. The second examination extracted the clinical and preventive medicine items from the task-supply assignments prepared by the SMEs. This resulted in the formation of the 4 revised AMMALs. The third examination was conducted to reveal objective measures of effectiveness. These measures yielded weight, cube, and cost differences between current and revised AMMALs. Finally, the data were examined to ascertain the underlying factors driving the proposed AMMAL refinements.

IDC Treatment/Preventive Medicine Tasks and Shipboard Treatment Area Capability

The treatment profiles were examined to determine what medical and preventive medicine tasks IDCs perform shipboard. Table 3 shows the domain of IDC-level tasks that were extracted from the profiles. Using the medical supply assignments the SMEs made to the tasks, the shipboard treatment area capabilities were also determined. It can be seen in Table 3 that treatment location exerts a fairly substantial effect on the types of tasks performed.

Revised AMMALs 7002, 7001, 7004, 7003

The revised AMMALs were derived from the task-supply assignments prepared by the SMEs. These task-supply relationships provided the clinical/preventive medicine requirements justifying the inclusion of the items in the revised AMMALs. Items that represented capability common to all 6 Navy platforms were grouped into the revised IDC Core AMMAL 7002 (Appendix C). Items that represented capability unique to an IDC platform were grouped into the revised IDC supplemental AMMAL 7001 (Appendix D). The same organizational structure was used to configure the laboratory AMMALs. Laboratory items in common with other platforms in the Fleet were grouped into the revised IDC laboratory core AMMAL 7004 (Appendix E), and the IDC unique laboratory items into IDC laboratory supplemental AMMAL 7003 (Appendix F).

Item, Weight, Cube, and Cost Differences

The 4 revised AMMALs were then compared to the current AMMALs to assess any differences in item quantity, weight, cube, or cost. Tables 4-7 show these results. Table 4 indicates that in the case of the IDC core AMMAL 7002, relatively modest overall reductions occurred in the measures of weight and cube. A number of items (12), however, were removed making AMMAL management somewhat easier. Furthermore, the cost of the AMMAL items was reduced, resulting in a savings of \$1,301.97 per ship.

Table 4
Comparison Between Current and Revised IDC Core AMMAL 7002

	No. of Items	Weight	Cubic Volume	Cost
Current IDC Core	242	656.5 lb.	81.9 cu. ft.	\$15,852.52
Revised IDC Core	230	641.0 lb.	78.4 cu. ft.	\$14,550.55
% Change	-5.0%	-2.4%	-4.3%	-8.2%

Whenever feasible, changes in the IDC core AMMAL were minimized. This principle was followed throughout the study because changes implemented in the IDC core mandated changes in the core AMMALs of the Fleet's remaining platforms. Consequently, each proposed revision in the IDC core was carefully scrutinized in terms of not only the clinical capability of the IDC platforms, but also in terms of the clinical capability of all 6 Navy platforms. Because most of the proposed revisions in the IDC core were deletions of items that represented a duplication of clinical capability with other items in the core, it is expected that these changes will garner acceptance from providers on the remaining 5 platforms.

Somewhat larger reductions in the number of items, weight, cube, and cost were realized in the IDC supplemental AMMAL. Table 5 shows that the number of items were reduced by 29.3%, resulting in a cost saving of \$4700.24 per ship. Because the core AMMAL represents the lowest common denominator of medical materiel required to operate the medical department of all Navy platforms, the IDC supplemental AMMAL should not, by definition, be a large block of materiel.

Table 5
Comparison Between Current and Revised IDC Supplemental AMMAL 7001

	No. of Items	Weight	Cubic Volume	Cost
Current IDC Core	116	1628.0 lb.	157.7 cu. ft.	\$21,312.97
Revised IDC Core	82	1332.9 lb.	138.6 cu. ft.	\$16,612.73
% Change	-29.3%	-18.1%	-12.1%	-22.1%

A different pattern of results was obtained for the IDC laboratory core AMMAL. Table 6 shows that increases resulted in each of the 4 comparative measures. These findings resulted from the addition of the 2 cardiac enzyme tests that were moved from the IDC supplemental AMMAL to the IDC laboratory core AMMAL. Because these two test kits require other laboratory gear to perform, such as blood-collecting needles and red top Vacutainers®, their inclusion in the laboratory AMMAL with the other tests kits is suggested. Had these two items not been moved from the supplemental, no revisions would have been proposed for this AMMAL.

Table 6
Comparison Between Current and Revised IDC Laboratory Core AMMAL 7004

	No. of Items	Weight	Cubic Volume	Cost
Current IDC Core	34	119.2 lb.	6.1 cu. ft.	\$3,318.26
Revised IDC Core	36	120.3 lb.	6.5 cu. ft.	\$3,840.02
% Change	5.9%	0.9%	7.7%	15.7%

The examination of the IDC laboratory supplemental AMMAL 7003 showed that the supply block supported all clinically required tests, as evidenced by the 0% change in the number of items. Reductions in item weight, cube, and cost, however, were realized due to a realignment of item quantities. These reductions, shown in Table 7, were possible because some shelf life sensitive items expire before they can be fully used. For example, the water-testing coliform reagent comes in cases of 200 units (\$667.76 per case) with a shelf life of 12 months. Assuming an average water/ice testing schedule of 7 times per week, a significant amount of the reagent will expire if the minimal AMMAL requirement remains unchanged. Modeling reagent usage using shelf life as a constraining variable showed that the ideal minimal requirement, if reduced from a 1-case to a .75-case requirement, would eliminate the expiration problem and result in significant monetary savings. It should be noted that this represents savings in addition to those shown in Table 7. The remaining high cost/short shelf-life items in the 7003 were subject to the same examination. Where warranted, minimal AMMAL quantity requirements were revised downward. Again, these are additional savings not reflected in Table 7.

Table 7
Comparison Between Current and Revised IDC Laboratory Supplemental AMMAL 7003

	No. of Items	Weight	Cubic Volume	Cost
Current IDC Core	14	61.7 lb.	3.8 cu. ft.	\$8,359.86
Revised IDC Core	14	59.3 lb.	3.5 cu. ft.	\$7,995.46
% Change	0.0%	-3.9%	-8.0%	-4.4%

Underlying Factors Supporting Clinical Requirements

Each revision in the blocks was based on the establishment of an overriding clinical or mission specific requirement. Because the establishment of such requirements is multi-faceted, various factors may underlie any single adjustment recommended for the supply blocks. As the SMEs debated revisions, various factors were cited justifying changes. To determine what factors were operating, each recommended item revision was examined in terms of the issues that guided the SMEs in their decision-making process. An examination of both the AMMAL 7002 IDC core and the 7001 IDC supplemental showed that the SMEs used 6 primary factors as justifications for their decisions.

Figure 1 shows these results for the IDC Core AMMAL 7002. Of the 242 total items in the AMMAL, 66 were affected by either a deletion, addition, or movement to another AMMAL. For these 66 item adjustments, 112 justifications for change were identified. The higher number of justifications is consistent with the study's intent to only implement AMMAL changes where there was an overriding justification to do so. Therefore, the majority of revisions have multiple justifications.

Figure 1. IDC Core AMMAL 7002 Item Change Justifications.

Figure 1 further shows that the elimination of items due to clinical redundancy with other items in the AMMAL was the most frequently identified reason for a change. The justification of deleting items because no clinical requirement could be substantiated followed closely behind. To a lesser extent, items were deleted because they failed to achieve the Fleet's new requirement for item standardization between platforms or due to issues related to cost. Support for deleting items was also found because items did not meet tri-service Department of Defense standardization requirements, however, no item was removed solely for this purpose. Figure 1 also shows that a number of factors were also found to be operating in the SMEs decisions to add items to the block. The most frequent justification for adding a new item to the block that advances in technology permitted a more effective approach to achieving an identified requirement or standard of care than currently possible with existing gear. Adding items because identified clinical requirements were not being met with existing materiel also exerted a significant effect on the change profile. In addition to the additions and deletions, items in the core were moved to other AMMALs either because an identified clinical requirement was better met in a different location or because of the Fleet's requirement for item standardization between platforms.

Additionally, an examination of the factors underlying the decisions to implement changes was conducted for the IDC supplemental AMMAL 7001. Figure 2 shows that the most active factor responsible for reducing the size of the 7001 was lack of an overriding clinical requirement justifying item inclusion. Also, a second factor, redundancy, was prominent in effecting change in this block. In these cases, items were removed from the AMMAL when a clinical requirement was already being effectively addressed by another item in either the core or supplemental AMMAL. This type of examination was not conducted on the 2 laboratory AMMALs because of insufficient data.

Figure 2. IDC Supplemental AMMAL 7001 Item Change Justifications.

CONCLUSIONS

Each of the study's objectives was achieved. A knowledge base of shipboard medical events was created, a comprehensive set of shipboard PCs was identified, treatment profiles were prepared, and medical supply items were related to each of the tasks in the profiles. Through this process, clinical requirements for the items in each AMMAL on the IDC platforms were identified, resulting in the validation of the work begun during the October 1997 standardization conference. While an overall reduction in materiel occurred through the deletion of items found to be redundant or lacking a clinical requirement, other items were added to achieve clinical requirements not currently being met. As a result, this provides the IDC with greater capability in achieving current standards of care and more closely matches shipboard medical materiel with skills IDCs are trained to perform.

The final step in the process of validating the IDC platform AMMALs is implementation of the refinements. As with all updates in the medical arena, timely implementation is important to ensure the results are not superseded by continuing advances. One approach to implementation is to hold a small, specialized AMMAL review conference, composed primarily of IDCs. Because some revisions occurred in the core AMMAL 7002, a small group of practitioners from each of the remaining 5 platforms should attend to ensure the changes are universally accepted. In addition to the 4 IDC AMMALs, the platform's emergent care AMMALs (BDS, PML, ERK, JRRERK, first-Aid, and Antidote Locker) should also be reviewed at this time. The NHRC validation study of the emergent AMMALs is nearing completion. Because the emergent AMMALs were validated within the context of the core AMMAL's capability, a review simultaneously encompassing the IDC and emergent AMMALs is recommended.

Part of the process of establishing clinical requirements was the production of the basic elements needed to develop an audit trail for each piece of medical materiel carried on the IDC platform. In the study, links were established between each relevant variable associated with the use of shipboard medical materiel. These links from medical condition to treatment task to supply provide medical planners specific information detailing the requirement for each consumable or piece of equipment. Detailed information about why each piece of gear may or may not be needed allows the AMMALs to be configured and modified in ways that maximize efficiency, reduce waste, improve clinical capability, and more closely match the medical mission with the operational mission.

With the IDC knowledge base complete, a foundation has been established upon which the supplemental AMMALs of the Fleet's remaining platforms can be evaluated. Because of its IDC-based medical departments, application of this method for optimizing the AMMALs should proceed with the submarine force. As the program begins to address the larger deck platforms including the GMO, LHA/LHD, and carriers, more sophisticated medical resource modeling efforts will be introduced. Because these larger platforms have much larger quantities of materiel, used at higher rates than those of the smaller decks, they can uniquely benefit from modeling supply usage characteristics. This will be accomplished by establishing the relative frequency that each of the PCs occur across the Fleet from data collected from sources such as the Shipboard Automated Medical System (SAMS) and casualty estimation models produced by NHRC.

13. ABSTRACT: The next step in the Fleet's efforts to enhance Authorized Minimum Medical Allowance List (AMMAL) efficiencies is the clinical validation of the individual AMMAL items and the development of an audit trail linking the items to their requirements. The primary objective of the study was to use this process to revise the Independent Duty Corpsman (IDC)-level AMMALs to contain only those items known to have a clinical task and a patient-driven clinical requirement. To accomplish this objective, Subject Matter Experts (SMEs) developed IDC-level treatment profiles for 336 Patient Conditions (PCs) known to occur aboard ship. These profiles, consisting of individual tasks, described the step-by-step process of providing clinical care for each of the PCs in each IDC treatment location, including sick call, laboratory, battle dressing station, portable medicine locker, emergency and junior emergency response kits, first-aid kit, and antidote locker. Once the profiles were prepared, SMEs assigned the required materiel to the tasks. The items used by IDCs in sick call and the laboratory were then separated into either the IDC core (7002), the IDC supplemental (7001), the IDC laboratory core (7004), or the IDC laboratory supplemental (7003), and analyzed to assess the significance of the changes. Each of the 4 revised AMMALs were compared to the existing blocks to assess differences in the number of items, weight, cube, and cost. The results showed reductions for each measure in 3 of the 4 AMMAL blocks. These reductions, realized in all but the IDC laboratory supplemental, were achieved at the same time that clinical capability was increased. In addition, each proposed revision was coded to reflect the type of justification SMEs used when agreeing to add, delete, or move an item to another AMMAL. The results showed that item changes occurred primarily because of (1) the failure to identify a clinical requirement or identification of clinical requirements not currently being met, (2) the identification of obsolete technology or the introduction of technologically superior materiel, or (3) the removal of items found to be redundant with other pieces of materiel. While an overall reduction in materiel occurred, items were added to achieve clinical requirements not currently being met. This now provides the IDC with greater capability in achieving current standards of care and more closely matches shipboard medical materiel with skills IDCs are trained to perform.
